

Project Part 1: Topic, Team, Functionality

Team:

Soham Shah
Jenn Dooley
Girish Ramkumar
Sam Taylor

Title:

JavaChess

Description:

A program which allows two players to play chess against each other using a GUI

Functionality:

- Players can pick which side they wish to play
- Players can type in the move they wish to do
- Players can click and drag the piece in order to indicate which move they want to do
- Chess board is shown including the letters and numbers for reference
- All chess mechanics are fully implemented
 - Includes castling and en passant

Stretch Functionality:

- Once this is fully implemented, we would like to port it to slack so that it can be used like a slack bot and players can play games against each other through messaging
- Also the bot would track the record between different players so you can play when taking a break from work
